

Advanced Machine Learning Summer 2019

Part 7 – Graphical Models I 25.04.2019

Prof. Dr. Bastian Leibe

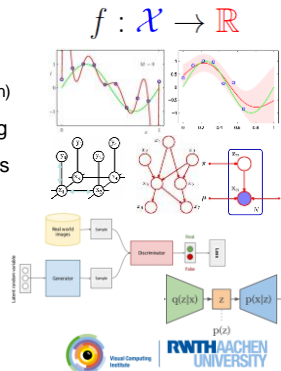

RWTH Aachen University, Computer Vision Group
<http://www.vision.rwth-aachen.de>

Many slides adapted from B. Schiele, S. Roth

Course Outline

- Regression Techniques
 - Linear Regression
 - Regularization (Ridge, Lasso)
 - Kernels (Kernel Ridge Regression)
- Deep Reinforcement Learning
- Probabilistic Graphical Models
 - Bayesian Networks
 - Markov Random Fields
 - Inference (exact & approximate)
- Deep Generative Models
 - Generative Adversarial Networks
 - Variational Autoencoders

2 Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Topics of This Lecture

- Probabilistic Graphical Models
 - Introduction
- Directed Graphical Models (Bayesian Networks)
 - Notation
 - Conditional probabilities
 - Computing the joint probability
 - Factorization
 - Conditional Independence
 - D-Separation
 - Explaining away

3 Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Graphical Models – What and Why?

- *It's got nothing to do with graphics!*
- Probabilistic graphical models
 - Marriage between probability theory and graph theory.
 - Formalize and visualize the structure of a probabilistic model through a graph.
 - Give insights into the structure of a probabilistic model.
 - Find efficient solutions using methods from graph theory.
 - Natural tool for dealing with uncertainty and complexity.
 - Has become an important way of designing and analyzing machine learning algorithms.

4 Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I
Slide credit: Bernd Schiele

Graphical Models

- There are two basic kinds of graphical models
 - Directed graphical models or Bayesian Networks
 - Undirected graphical models or Markov Random Fields
- Key components
 - Nodes
 - Edges
 - Directed or undirected

5 Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I
Slide credit: Bernd Schiele

Topics of This Lecture

- Graphical Models

- Directed Graphical Models (Bayesian Networks)
 - Notation
 - Conditional probabilities
 - Computing the joint probability
 - Factorization
 - Conditional Independence
 - D-Separation
 - Explaining away

6 Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Example: Wet Lawn

- Mr. Holmes leaves his house.
 - He sees that the lawn in front of his house is wet.
 - This can have several reasons: Either it rained, or Holmes forgot to shut the sprinkler off.
 - Without any further information, the probability of both events (rain, sprinkler) increases (knowing that the lawn is wet).
 - Now Holmes looks at his neighbor's lawn
 - The neighbor's lawn is also wet.
 - This information increases the probability that it rained. And it lowers the probability for the sprinkler.
- ⇒ How can we encode such probabilistic relationships?

Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- or **Bayesian networks**
 - Are based on a **directed graph**.
 - The **nodes** correspond to the **random variables**.
 - The directed edges correspond to the (causal) **dependencies** among the variables.
 - The notion of a causal nature of the dependencies is somewhat hard to grasp.
 - We will typically ignore the notion of causality here...
 - The **structure of the network qualitatively describes the dependencies of the random variables**.

9

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- **Nodes or random variables**
 - We usually know the range of the random variables.
 - The value of a variable may be **known** or **unknown**.
 - If they are **known** (observed), we usually shade the node:

- **Examples of variable nodes**
 - Binary events: Rain (yes / no), sprinkler (yes / no)
 - Discrete variables: Ball is red, green, blue, ...
 - Continuous variables: Age of a person, ...

10

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- Most often, we are interested in **quantitative statements**
 - i.e. the probabilities (or densities) of the variables.
 - Example: What is the probability that it rained? ...
 - These probabilities change if we have
 - more knowledge,
 - less knowledge, or
 - different knowledge
 about the other variables in the network.

11

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- Simplest case:

- This model encodes
 - The value of b depends on the value of a .
 - This dependency is expressed through the **conditional probability**:
 $p(b|a)$
 - Knowledge about a is expressed through the **prior probability**:
 $p(a)$
 - The whole graphical model describes the **joint probability** of a and b :

$$p(a, b) = p(b|a)p(a)$$

12

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- If we have such a representation, we can derive all other interesting probabilities from the joint.

– E.g., **marginalization**

$$p(a) = \sum_b p(a, b) = \sum_b p(b|a)p(a)$$

$$p(b) = \sum_a p(a, b) = \sum_a p(b|a)p(a)$$

– With the marginals, we can also compute other **conditional probabilities**:

$$p(a|b) = \frac{p(a, b)}{p(b)}$$

13

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- Chains of nodes:**

– As before, we can compute

$$p(a, b) = p(b|a)p(a)$$

– But we can also compute the joint distribution of all three variables:

$$p(a, b, c) = p(c|a, b)p(a, b) \\ = p(c|b)p(b|a)p(a)$$

– We can read off from the graphical representation that variable c does not depend on a , if b is known.

- How? What does this mean?

14

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- Convergent connections:**

– Here the value of c depends on both variables a and b .

– This is modeled with the conditional probability:

$$p(c|a, b)$$

– Therefore, the joint probability of all three variables is given as:

$$p(a, b, c) = p(c|a, b)p(a, b) \\ = p(c|a, b)p(a)p(b)$$

15

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Slide credit: Bernd Schiele, Stefan Roth

Example

$p(C)$

	$p(C = F) \quad p(C = T)$		
	0.5	0.5	

	$p(S C)$	
C	$p(S = F)$	$p(S = T)$
F	0.5	0.5
T	0.9	0.1

	$p(R C)$	
C	$p(R = F)$	$p(R = T)$
F	0.8	0.2
T	0.2	0.8

$p(W|R, S)$

SR	$p(W = F)$	$p(W = T)$
FF	1.0	0.0
TF	0.1	0.9
FT	0.1	0.9
TT	0.01	0.99

Let's see what such a Bayesian network could look like...

- Structure?
- Variable types? Binary.
- Conditional probabilities?

16

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Slide credit: Bernd Schiele, Stefan Roth

Example

- Evaluating the Bayesian network...**

– We start with the simple product rule:

$$p(a, b, c) = p(a|b, c)p(b, c) \\ = p(a|b, c)p(b|c)p(c)$$

– This means that we can rewrite the joint probability of the variables as

$$p(C, S, R, W) = p(C)p(S|C)p(R|C)p(W|C, S, R)$$

– But the Bayesian network tells us that

$$p(C, S, R, W) = p(C)p(S|C)p(R|C)p(W|S, R)$$

- I.e. rain is independent of sprinkler (given the cloudyness).
 - Wet grass is independent of the cloudiness (given the state of the sprinkler and the rain).
- ⇒ This is a **factorized representation of the joint probability**.

17

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- A general directed graphical model (Bayesian network) consists of

– A set of variables: $U = \{x_1, \dots, x_n\}$

– A set of directed edges between the variable nodes.

– The variables and the directed edges define an **acyclic graph**.

- Acyclic means that there is no directed cycle in the graph.

– For each variable x_i with parent nodes pa_i in the graph, we require knowledge of a **conditional probability**:

$$p(x_i | \{x_j | j \in pa_i\})$$

18

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

Slide credit: Bernd Schiele, Stefan Roth

Directed Graphical Models

- Given

- Variables: $U = \{x_1, \dots, x_n\}$
- Directed acyclic graph: $G = (V, E)$
 - V: nodes = variables, E: directed edges

We can express / compute the joint probability as

$$p(x_1, \dots, x_n) = \prod_{i=1}^n p(x_i | \{x_j | j \in \text{pa}_i\})$$

where pa_i denotes the parent nodes of x_i .

- We can express the joint as a product of all the conditional distributions from the parent-child relations in the graph.
- We obtain a factorized representation of the joint.

Factorized Representation

- Reduction of complexity

– Joint probability of n binary variables requires us to represent values by brute force

$$\mathcal{O}(2^n) \text{ terms}$$

– The factorized form obtained from the graphical model only requires

$$\mathcal{O}(n \cdot 2^k) \text{ terms}$$

- k : maximum number of parents of a node.

26

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 - Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Example: Classifier Learning

- Bayesian classifier learning

– Given N training examples $\mathbf{x} = \{x_1, \dots, x_N\}$ with target values \mathbf{t}

– We want to optimize the classifier y with parameters \mathbf{w} .

– We can express the joint probability of \mathbf{t} and \mathbf{w} :

$$p(\mathbf{t}, \mathbf{w}) = p(\mathbf{w}) \prod_{n=1}^N p(t_n | y(\mathbf{w}, x_n))$$

– Corresponding Bayesian network:

Short notation:

– “Plate”
(short notation for N copies)

27

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 - Graphical Models I

RWTH AACHEN
UNIVERSITY

Conditional Independence

- Suppose we have a joint density with 4 variables.

$$p(x_0, x_1, x_2, x_3)$$

– For example, 4 subsequent words in a sentence:

x_0 = “Machine”, x_1 = “learning”, x_2 = “is”, x_3 = “fun”

- The product rule tells us that we can rewrite the joint density:

$$p(x_0, x_1, x_2, x_3) = p(x_3 | x_0, x_1, x_2) p(x_0, x_1, x_2) \\ = p(x_3 | x_0, x_1, x_2) p(x_2 | x_0, x_1) p(x_0, x_1) \\ = p(x_3 | x_0, x_1, x_2) p(x_2 | x_0, x_1) p(x_1 | x_0) p(x_0)$$

28

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 - Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Conditional Independence

$$p(x_0, x_1, x_2, x_3) = p(x_3 | x_0, x_1, x_2) p(x_2 | x_0, x_1) p(x_1 | x_0) p(x_0)$$

- Now, suppose we make a **simplifying assumption**

– Only the previous word is what matters, i.e. given the previous word we can forget about every word before the previous one.

– E.g. $p(x_3 | x_0, x_1, x_2) = p(x_3 | x_2)$ or $p(x_2 | x_0, x_1) = p(x_2 | x_1)$

– Such assumptions are called **conditional independence assumptions**.

– They are directly reflected in the structure of the graphical model.

⇒ It's the edges that are missing in the graph that are important!
They encode the simplifying assumptions we make.

29

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 - Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Conditional Independence

- The notion of **conditional independence** means that
- Given a certain variable, other variables become independent.

– More concretely here:

$$p(x_3 | x_0, x_1, x_2) = p(x_3 | x_2)$$

- This means that x_3 is conditionally independent from x_0 and x_1 given x_2 .

$$p(x_2 | x_0, x_1) = p(x_2 | x_1)$$

- This means that x_2 is conditionally independent from x_0 given x_1 .

– Why is this?

$$p(x_0, x_2 | x_1) = p(x_2 | \cancel{x_0}, x_1) p(x_0 | x_1)$$

$$= p(x_2 | x_1) p(x_0 | x_1)$$

independent given x_1

30

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 - Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Conditional Independence – Notation

- X is **conditionally independent** of Y given V
 - Equivalence: $X \perp\!\!\!\perp Y | V \Leftrightarrow p(X|Y, V) = p(X|V)$
 - Also: $X \perp\!\!\!\perp Y | V \Leftrightarrow p(X, Y|V) = p(X|V)p(Y|V)$
 - Special case: **Marginal Independence**

$$X \perp\!\!\!\perp Y \Leftrightarrow X \perp\!\!\!\perp Y | \emptyset \Leftrightarrow p(X, Y) = p(X)p(Y)$$
 - Often, we are interested in conditional independence between **sets of variables**:

$$\mathcal{X} \perp\!\!\!\perp \mathcal{Y} | \mathcal{V} \Leftrightarrow \{X \perp\!\!\!\perp Y | \mathcal{V}, \forall X \in \mathcal{X} \text{ and } \forall Y \in \mathcal{Y}\}$$

31

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Conditional Independence

- Directed graphical models are not only useful...
 - Because the joint probability is factorized into a product of simpler conditional distributions.
 - But also, because we can **read off the conditional independence of variables**.
- Let's discuss this in more detail...

32

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

First Case: Divergent (“Tail-to-Tail”)

- Divergent model

- Are a and b independent?
- Marginalize out c :

$$p(a, b) = \sum_c p(a, b, c) = \sum_c p(a|c)p(b|c)p(c)$$
- In general, this is not equal to $p(a)p(b)$.
 \Rightarrow The variables are **not independent**.

33

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

First Case: Divergent (“Tail-to-Tail”)

- What about now?

- Are a and b independent?
- Marginalize out c :

$$p(a, b) = \sum_c p(a, b, c) = \sum_c p(a|c)p(b)p(c) = p(a)p(b)$$
- \Rightarrow If there is **no undirected connection** between two variables, then they are **independent**.

34

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

First Case: Divergent (“Tail-to-Tail”)

- Let's return to the original graph, but now assume that we **observe the value of** c :

- The conditional probability is given by:

$$p(a, b|c) = \frac{p(a, b, c)}{p(c)} = \frac{p(a|c)p(b|c)p(c)}{p(c)} = p(a|c)p(b|c)$$
- \Rightarrow If c becomes known, the variables a and b become **conditionally independent**.

35

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Second Case: Chain (“Head-to-Tail”)

- Let us consider a slightly different graphical model:

Chain graph

- Are a and b independent? **No!**

$$p(a, b) = \sum_c p(a, b, c) = \sum_c p(b|c)p(c)p(a) = p(b|a)p(a)$$
- If c becomes known, are a and b **conditionally independent**? **Yes!**

$$p(a, b|c) = \frac{p(a, b, c)}{p(c)} = \frac{p(a)p(c)p(b|c)}{p(c)} = p(a)p(b|c)$$

36

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Third Case: Convergent ("Head-to-Head")

- Let's look at a final case: Convergent graph

- Are a and b independent? **YES!**

$$p(a, b) = \sum_c p(a, b, c) = \sum_c p(c|a, b)p(a)p(b) = p(a)p(b)$$

- This is very different from the previous cases.
- Even though a and b are connected, they are independent.

37

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Image source: C. Bishop, 2006

Third Case: Convergent ("Head-to-Head")

- Now we assume that c is observed

- Are a and b independent? **NO!**

$$p(a, b|c) = \frac{p(a, b, c)}{p(c)} = \frac{p(a)p(b)p(c|a, b)}{p(c)}$$

- In general, they are not conditionally independent.
 - This also holds when any of c 's descendants is observed.
- This case is the opposite of the previous cases!

38

Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I

RWTH AACHEN
UNIVERSITY

Slide credit: Bernd Schiele, Stefan Roth

Image source: C. Bishop, 2006

Summary: Conditional Independence

- Three cases

- Divergent** ("Tail-to-Tail")
 - Conditional independence when c is observed.
- Chain** ("Head-to-Tail")
 - Conditional independence when c is observed.
- Convergent** ("Head-to-Head")
 - Conditional independence when **neither c , nor any of its descendants** are observed.

D-Separation

- Definition

- Let A , B , and C be non-intersecting subsets of nodes in a directed graph.
- A path from A to B is **blocked** if it contains a node such that either
 - The arrows on the path meet either **head-to-tail** or **tail-to-tail** at the node, and the **node is in the set C** , or
 - The arrows meet **head-to-head** at the node, and **neither the node, nor any of its descendants, are in the set C** .
- If all paths from A to B are blocked, A is said to be **d-separated** from B by C .
- If A is d-separated from B by C , the joint distribution over all variables in the graph satisfies $A \perp\!\!\!\perp B \mid C$.
 - Read: " A is conditionally independent of B given C ."

Intuitive View: The "Bayes Ball" Algorithm

- Game

- Can you get a ball from X to Y without being blocked by \mathcal{V} ?
- Depending on its direction and the previous node, the ball can
 - Pass through (from parent to all children, from child to all parents)
 - Bounce back (from any parent/child to all parents/children)
 - Be blocked

RWTH AACHEN
UNIVERSITY

Slide adapted from Zoubin Ghahramani

The "Bayes Ball" Algorithm

- Game rules

- An **unobserved** node ($W \notin \mathcal{V}$) passes through balls from parents, but also bounces back balls from children.

- An **observed** node ($W \in \mathcal{V}$) bounces back balls from parents, but blocks balls from children.

- ⇒ The Bayes Ball algorithm determines those nodes that are d-separated from the query node.

Summary

- Graphical models
 - Marriage between probability theory and graph theory.
 - Give insights into the structure of a probabilistic model.
 - Direct dependencies between variables.
 - Conditional independence
 - Allow for efficient factorization of the joint.
 - Factorization can be read off directly from the graph.
 - We will use this for efficient inference algorithms!
 - Capability to explain away hypotheses by new evidence.
- Next lecture
 - Undirected graphical models (Markov Random Fields)
 - Efficient methods for performing exact inference.

58 Visual Computing Institute | Prof. Dr. Bastian Leibe
Advanced Machine Learning
Part 7 – Graphical Models I
RWTH AACHEN UNIVERSITY
Image source: C. Bishop, 2006

References and Further Reading

- A thorough introduction to Graphical Models in general and Bayesian Networks in particular can be found in Chapter 8 of Bishop's book.
