# Computer Vision - Lecture 13

## Local Features II

09.12.2014

Computer Vision WS 14/15

Bastian Leibe  
RWTH Aachen  
<http://www.vision.rwth-aachen.de>  
leibe@vision.rwth-aachen.de

RWTH AACHEN  
UNIVERSITY

## Course Outline

- Image Processing Basics
- Segmentation & Grouping
- Object Recognition
- Object Categorization I
  - Sliding Window based Object Detection
- Local Features & Matching
  - Local Features - Detection and Description
  - Recognition with Local Features
- Object Categorization II
  - Part based Approaches
- 3D Reconstruction
- Motion and Tracking

3

RWTH AACHEN  
UNIVERSITY

## Recap: Local Feature Matching Outline

1. Find a set of distinctive key-points
2. Define a region around each keypoint
3. Extract and normalize the region content
4. Compute a local descriptor from the normalized region
5. Match local descriptors

$d(f_A, f_B) < T$

4

RWTH AACHEN  
UNIVERSITY

## Recap: Requirements for Local Features

- Problem 1:
  - Detect the same point *independently* in both images
- Problem 2:
  - For each point correctly recognize the corresponding one

**We need a repeatable detector!**

**We need a reliable and distinctive descriptor!**

5

RWTH AACHEN  
UNIVERSITY

## Recap: Harris Detector [Harris88]

- Compute second moment matrix (autocorrelation matrix)

$$M(\sigma_x, \sigma_y) = g(\sigma_x) * \begin{bmatrix} I_x^2(\sigma_y) & I_x I_y(\sigma_y) \\ I_x I_y(\sigma_y) & I_y^2(\sigma_y) \end{bmatrix}$$

1. Image derivatives
2. Square of derivatives
3. Gaussian filter  $g(\sigma)$

4. Cornerness function - two strong eigenvalues

$$R = \det[M(\sigma_x, \sigma_y)] - \alpha [\text{trace}(M(\sigma_x, \sigma_y))]^2$$

$$= g(I_x^2)g(I_y^2) - [g(I_x I_y)]^2 - \alpha [g(I_x^2) + g(I_y^2)]^2$$

5. Perform non-maximum suppression

6

RWTH AACHEN  
UNIVERSITY

## Recap: Harris Detector Responses [Harris88]

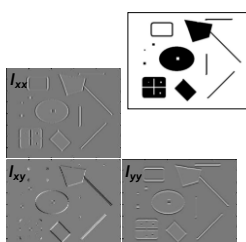

**Effect:** A very precise corner detector.

6

RWTH AACHEN UNIVERSITY

## Recap: Hessian Detector [Beaudet78]

- Hessian determinant

$$Hessian(I) = \begin{bmatrix} I_{xx} & I_{xy} \\ I_{xy} & I_{yy} \end{bmatrix}$$

$$\det(Hessian(I)) = I_{xx}I_{yy} - I_{xy}^2$$

In Matlab:

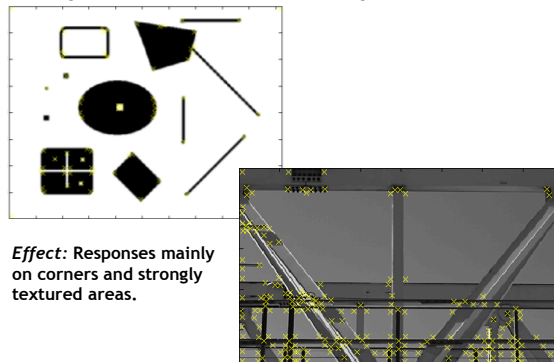

$$I_{xx} * I_{yy} - (I_{xy})^2$$

Slide credit: Krystian Mikolajczyk

8

RWTH AACHEN UNIVERSITY

## Recap: Hessian Detector Responses [Beaudet78]

Effect: Responses mainly on corners and strongly textured areas.

Slide credit: Krystian Mikolajczyk

RWTH AACHEN UNIVERSITY

## Topics of This Lecture

- Local Feature Extraction (cont'd)
  - Scale Invariant Region Selection
  - Orientation normalization
  - Affine Invariant Feature Extraction
- Local Descriptors
  - SIFT
- Applications

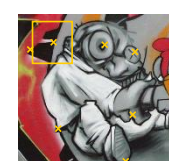

Slide credit: Krystian Mikolajczyk

10

RWTH AACHEN UNIVERSITY

## From Points to Regions...

- The Harris and Hessian operators define interest points.
  - Precise localization
  - High repeatability
- In order to compare those points, we need to compute a descriptor over a region.
  - How can we define such a region in a scale invariant manner?
- i.e. how can we detect scale invariant interest regions?*

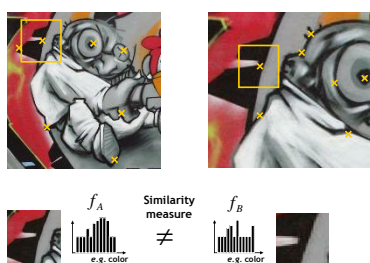

Slide credit: Krystian Mikolajczyk

11

RWTH AACHEN UNIVERSITY

## Naïve Approach: Exhaustive Search

- Multi-scale procedure
  - Compare descriptors while varying the patch size

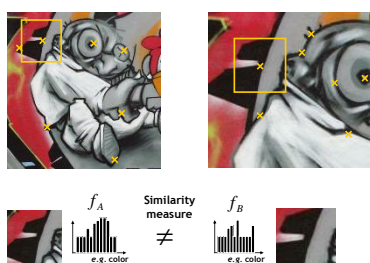

Slide credit: Krystian Mikolajczyk

12

RWTH AACHEN UNIVERSITY

## Automatic Scale Selection

- Solution:
  - Design a function on the region, which is "scale invariant" (the same for corresponding regions, even if they are at different scales)

Example: average intensity. For corresponding regions (even of different sizes) it will be the same.

- For a point in one image, we can consider it as a function of region size (patch width)

Computer Vision WS 14/15

17

Slide credit: Kristen Grauman

RWTH AACHEN UNIVERSITY

## Automatic Scale Selection

- Common approach:
  - Take a local maximum of this function.
  - Observation: region size for which the maximum is achieved should be invariant to image scale.

Important: this scale invariant region size is found in each image independently!

34

Computer Vision WS 14/15

## Difference-of-Gaussian (DoG)

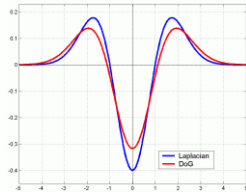

- We can efficiently approximate the Laplacian with a difference of Gaussians:

$$L = \sigma^2 (G_{xx}(x, y, \sigma) + G_{yy}(x, y, \sigma))$$

(Laplacian)

$$DoG = G(x, y, k\sigma) - G(x, y, \sigma)$$

(Difference of Gaussians)

- Advantages?
  - No need to compute 2<sup>nd</sup> derivatives.
  - Gaussians are computed anyway, e.g. in a Gaussian pyramid.

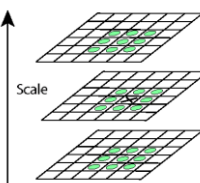

Slide credit: Svetlana Lazebnik B. Leibe

35

Computer Vision WS 14/15

## Key point localization with DoG

- Detect maxima of difference-of-Gaussian (DoG) in scale space
- Then reject points with low contrast (threshold)
- Eliminate edge responses

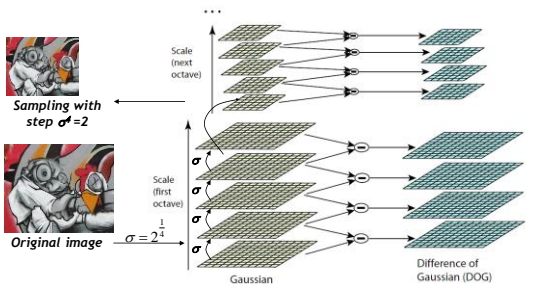

Candidate keypoints: list of (x,y,σ)

Slide credit: David Lowe

Computer Vision WS 14/15

## DoG - Efficient Computation

- Computation in Gaussian scale pyramid

RWTH AACHEN UNIVERSITY

## Summary: Scale Invariant Detection

- **Given:** Two images of the same scene with a large *scale difference* between them.
- **Goal:** Find *the same* interest points *independently* in each image.
- **Solution:** Search for *maxima* of suitable functions in *scale* and in *space* (over the image).
- **Two strategies**
  - Laplacian-of-Gaussian (LoG)
  - Difference-of-Gaussian (DoG) as a fast approximation
  - *These can be used either on their own, or in combinations with single-scale keypoint detectors (Harris, Hessian).*

## Topics of This Lecture

- **Local Feature Extraction (cont'd)**
  - Scale Invariant Region Selection
  - Orientation normalization
  - Affine Invariant Feature Extraction
- **Local Descriptors**
  - SIFT
- **Applications**

B. Leibe

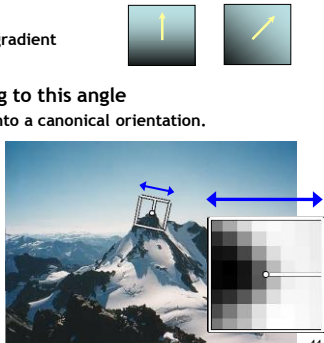

43

Computer Vision WS 14/15

RWTH AACHEN UNIVERSITY

## Rotation Invariant Descriptors

- **Find local orientation**
  - Dominant direction of gradient for the image patch
- **Rotate patch according to this angle**
  - This puts the patches into a canonical orientation.

Slide credit: Svetlana Lazebnik, Matthew Brown

44

RWTH AACHEN UNIVERSITY

## Orientation Normalization: Computation

- Compute orientation histogram [Lowe, SIFT, 1999]
- Select dominant orientation
- Normalize: rotate to fixed orientation

Computer Vision WS 14/15

Slide adapted from David Lowe

RWTH AACHEN UNIVERSITY

## Topics of This Lecture

- Local Feature Extraction (cont'd)
  - Scale Invariant Region Selection
  - Orientation normalization
  - Affine Invariant Feature Extraction
- Local Descriptors
  - SIFT
- Applications

Computer Vision WS 14/15

B. Leibe 46

RWTH AACHEN UNIVERSITY

## The Need for Invariance

- Up to now, we had invariance to
  - Translation
  - Scale
  - Rotation
- Not sufficient to match regions under viewpoint changes
  - For this, we need also affine adaptation

Computer Vision WS 14/15

B. Leibe 47

Slide credit: Tinne Tuytelaars

RWTH AACHEN UNIVERSITY

## Affine Adaptation

- Problem:
  - Determine the characteristic shape of the region.
  - Assumption: shape can be described by "local affine frame".
- Solution: iterative approach
  - Use a circular window to compute second moment matrix.
  - Compute eigenvectors to adapt the circle to an ellipse.
  - Recompute second moment matrix using new window and iterate...

Computer Vision WS 14/15

B. Leibe 48

Slide adapted from Svetlana Lazebnik

RWTH AACHEN UNIVERSITY

## Iterative Affine Adaptation

1. Detect keypoints, e.g. multi-scale Harris
2. Automatically select the scales
3. Adapt affine shape based on second order moment matrix
4. Refine point location

Computer Vision WS 14/15

K. Mikolajczyk and C. Schmid, *Scale and affine invariant interest point detectors*, IJCV 60(1):63-86, 2004. Slide credit: Tinne Tuytelaars 49

RWTH AACHEN UNIVERSITY

## Affine Normalization/Deskewing

rotate      rescale

- Steps
  - Rotate the ellipse's main axis to horizontal
  - Scale the x axis, such that it forms a circle

Computer Vision WS 14/15

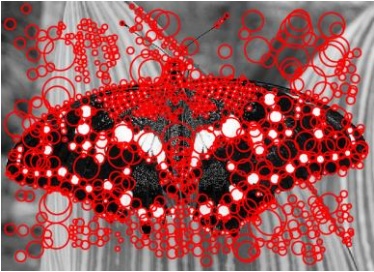

B. Leibe 50

Slide credit: Tinne Tuytelaars

RWTH AACHEN UNIVERSITY

## Affine Adaptation Example

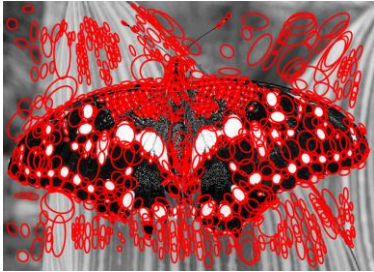

Scale-invariant regions (blobs)

Computer Vision WS 14/15

RWTH AACHEN UNIVERSITY

## Summary: Affine-Inv. Feature Extraction

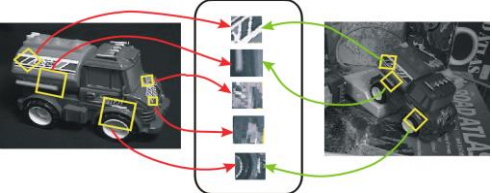

Computer Vision WS 14/15

Slide credit: Svetlana Lazebnik B. Leibe 53

RWTH AACHEN UNIVERSITY

## Invariance vs. Covariance

- Invariance:**
  - $features(transform(image)) = features(image)$
- Covariance:**
  - $features(transform(image)) = transform(features(image))$

Covariant detection  $\Rightarrow$  invariant description

Computer Vision WS 14/15

Slide credit: Svetlana Lazebnik, David Lowe B. Leibe 54

RWTH AACHEN UNIVERSITY

## Topics of This Lecture

- Local Feature Extraction (cont'd)
  - Orientation normalization
  - Affine Invariant Feature Extraction
- Local Descriptors
  - SIFT
  - Applications
- Recognition with Local Features
  - Matching local features
  - Finding consistent configurations
  - Alignment: linear transformations
  - Affine estimation
  - Homography estimation

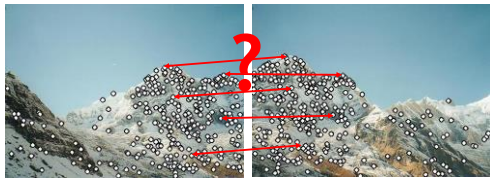

Computer Vision WS 14/15

B. Leibe 55

RWTH AACHEN UNIVERSITY

## Local Descriptors

- We know how to detect points
- Next question:
  - How to describe them for matching?

Point descriptor should be:

- Invariant
- Distinctive

Computer Vision WS 14/15

Slide credit: Kristen Grauman B. Leibe 56

Computer Vision WS 14/15

## Local Descriptors

- Simplest descriptor: list of intensities within a patch.
- What is this going to be invariant to?

Write regions as vectors  
 $A \rightarrow a, B \rightarrow b$

region A      region B

vector a      vector b

Slide credit: Kristen Grauman      B. Leibe      57

Computer Vision WS 14/15

## Feature Descriptors

- Disadvantage of patches as descriptors:
  - Small shifts can affect matching score a lot

- Solution: histograms

Slide credit: Svetlana Lazebnik      B. Leibe      58

Computer Vision WS 14/15

## Feature Descriptors: SIFT

- Scale Invariant Feature Transform
- Descriptor computation:
  - Divide patch into 4x4 sub-patches: 16 cells
  - Compute histogram of gradient orientations (8 reference angles) for all pixels inside each sub-patch
  - Resulting descriptor: 4x4x8 = 128 dimensions

David G. Lowe, "Distinctive image features from scale-invariant keypoints." *IJCV* 60 (2), pp. 91-110, 2004.

Slide credit: Svetlana Lazebnik      B. Leibe      59

Computer Vision WS 14/15

## Overview: SIFT

- Extraordinarily robust matching technique
  - Can handle changes in viewpoint up to ~60 deg. out-of-plane rotation
  - Can handle significant changes in illumination
    - Sometimes even day vs. night (below)
  - Fast and efficient—can run in real time
  - Lots of code available
    - [http://people.csail.mit.edu/albert/ladypack/wiki/index.php/known\\_Implementations\\_of\\_SIFT](http://people.csail.mit.edu/albert/ladypack/wiki/index.php/known_Implementations_of_SIFT)

Slide credit: Steve Seitz

Computer Vision WS 14/15

## Working with SIFT Descriptors

- One image yields:
  - $n$  2D points giving positions of the patches
    - [n x 2 matrix]
  - $n$  scale parameters specifying the size of each patch
    - [n x 1 vector]
  - $n$  orientation parameters specifying the angle of the patch
    - [n x 1 vector]
  - $n$  128-dimensional descriptors: each one is a histogram of the gradient orientations within a patch
    - [n x 128 matrix]

Slide credit: Steve Seitz      B. Leibe      61

Computer Vision WS 14/15

## Local Descriptors: SURF

- Fast approximation of SIFT idea
  - Efficient computation by 2D box filters & integral images
    - ⇒ 6 times faster than SIFT
  - Equivalent quality for object identification
  - <http://www.vision.ee.ethz.ch/~surf>
- GPU implementation available
  - Feature extraction @ 100Hz (detector + descriptor, 640x480 img)
  - <http://homes.esat.kuleuven.be/~normelli/gpusurf/>

## Value of Local Features

- Advantages
  - Critical to find distinctive and repeatable local regions for multi-view matching.
  - Complexity reduction via selection of distinctive points.
  - Describe images, objects, parts without requiring segmentation; robustness to clutter & occlusion.
  - Robustness: similar descriptors in spite of moderate view changes, noise, blur, etc.
- How can we use local features for such applications?
  - Next week: matching and recognition
