Computer Vision WS 15/16

RWTH AACHEN
UNIVERSITY

Course Outline

- Image Processing Basics
- Segmentation & Grouping
- Object Recognition & Categorization I
 - Global Representations
 - Sliding Window based Object Detection
- Local Features & Matching
 - Local Features - Detection and Description
 - Recognition with Local Features
- Object Categorization II
 - Part based Approaches
 - Deep Learning Approaches
- 3D Reconstruction
- Motion and Tracking

2

RWTH AACHEN
UNIVERSITY

Recap: Sliding-Window Object Detection

- If object may be in a cluttered scene, slide a window around looking for it.

- Essentially, this is a brute-force approach with many local decisions.

3

RWTH AACHEN
UNIVERSITY

Recap: AdaBoost

Final classifier is combination of the weak classifiers

5

Slide credit: Kristen Grauman B. Leibe

RWTH AACHEN
UNIVERSITY

Recap: AdaBoost Feature+Classifier Selection

- Want to select the single rectangle feature and threshold that best separates **positive** (faces) and **negative** (non-faces) training examples, in terms of **weighted error**.

Resulting weak classifier:

$$h_i(x) = \begin{cases} +1 & \text{if } f_i(x) > \theta_i \\ -1 & \text{otherwise} \end{cases}$$

For next round, reweight the examples according to errors, choose another filter/threshold combo.

6

Slide credit: Kristen Grauman B. Leibe [Viola & Jones, CVPR 2001]

RWTH AACHEN UNIVERSITY

Recap: Viola-Jones Face Detector

- Train with 5K positives, 350M negatives
- Real-time detector using 38 layer cascade
- 6061 features in final layer
- [Implementation available in OpenCV: <http://sourceforge.net/projects/opencvlibrary/>]

Computer Vision WS 15/16 7

Slide credit: Kristen Grauman B. Leibe

RWTH AACHEN UNIVERSITY

Topics of This Lecture

- Local Invariant Features
 - Motivation
 - Requirements, Invariances
- Keypoint Localization
 - Harris detector
 - Hessian detector
- Scale Invariant Region Selection
 - Automatic scale selection
 - Laplacian-of-Gaussian detector
 - Difference-of-Gaussian detector
 - Combinations
- Local Descriptors
 - Orientation normalization
 - SIFT

Computer Vision WS 15/16 8

B. Leibe

RWTH AACHEN UNIVERSITY

Motivation

- Global representations have major limitations
- Instead, describe and match only local regions
- Increased robustness to
 - Occlusions
 - Articulation
 - Intra-category variations

RWTH AACHEN UNIVERSITY

Application: Image Stitching

- Procedure:
 - Detect feature points in both images
 - Find corresponding pairs
 - Use these pairs to align the images

B. Leibe

17

Computer Vision WS 15/16

Slide credit: Darva Erolova, Denis Simakov

RWTH AACHEN UNIVERSITY

General Approach

1. Find a set of distinctive keypoints
2. Define a region around each keypoint
3. Extract and normalize the region content
4. Compute a local descriptor from the normalized region
5. Match local descriptors

B. Leibe

18

Computer Vision WS 15/16

RWTH AACHEN UNIVERSITY

Common Requirements

- Problem 1:
 - Detect the same point *independently* in both images

No chance to match!

We need a repeatable detector!

Computer Vision WS 15/16 19

Slide credit: Darya Frolova, Denis Simakov, B. Leibe

RWTH AACHEN UNIVERSITY

Common Requirements

- Problem 1:
 - Detect the same point *independently* in both images
- Problem 2:
 - For each point correctly recognize the corresponding one

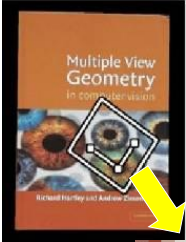

We need a reliable and distinctive descriptor!

Computer Vision WS 15/16 20

RWTH AACHEN UNIVERSITY

Invariance: Geometric Transformations

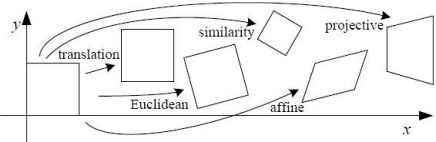

Computer Vision WS 15/16 21

Slide credit: Steve Seitz, B. Leibe

RWTH AACHEN UNIVERSITY

Levels of Geometric Invariance

Computer Vision WS 15/16 22

B. Leibe

RWTH AACHEN UNIVERSITY

Requirements

- Region extraction needs to be **repeatable** and **accurate**
 - **Invariant** to translation, rotation, scale changes
 - **Robust** or **covariant** to out-of-plane (affine) transformations
 - **Robust** to lighting variations, noise, blur, quantization
- **Locality**: Features are local, therefore robust to occlusion and clutter.
- **Quantity**: We need a sufficient number of regions to cover the object.
- **Distinctiveness**: The regions should contain "interesting" structure.
- **Efficiency**: Close to real-time performance.

Computer Vision WS 15/16 24

B. Leibe

RWTH AACHEN UNIVERSITY

Many Existing Detectors Available

| | |
|---------------------------|-----------------------------|
| • Hessian & Harris | [Beaudet '78], [Harris '88] |
| • Laplacian, DoG | [Lindeberg '98], [Lowe '99] |
| • Harris-/Hessian-Laplace | [Mikolajczyk & Schmid '01] |
| • Harris-/Hessian-Affine | [Mikolajczyk & Schmid '04] |
| • EBR and IBR | [Tuytelaars & Van Gool '04] |
| • MSER | [Matas '02] |
| • Salient Regions | [Kadir & Brady '01] |
| • Others... | |

- *Those detectors have become a basic building block for many recent applications in Computer Vision.*

Computer Vision WS 15/16 26

B. Leibe

RWTH AACHEN UNIVERSITY

Keypoint Localization

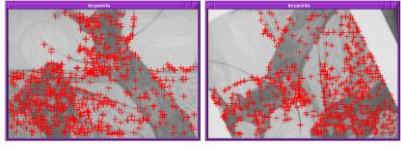

- Goals:
 - Repeatability
 - Precise localization
 - Interesting content

⇒ Look for two-dimensional signal changes

27

RWTH AACHEN UNIVERSITY

Finding Corners

- Key property:
 - In the region around a corner, image gradient has two or more dominant directions
- Corners are *repeatable and distinctive*

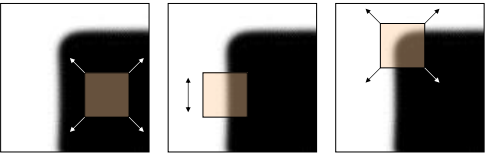

C.Harris and M.Stephens. "A Combined Corner and Edge Detector." *Proceedings of the 4th Alvey Vision Conference, 1988.*

28

RWTH AACHEN UNIVERSITY

Corners as Distinctive Interest Points

- Design criteria
 - We should easily recognize the point by looking through a small window (*locality*)
 - Shifting the window in *any direction* should give a large change in intensity (*good localization*)

"flat" region: no change in all directions

"edge": no change along the edge direction

"corner": significant change in all directions

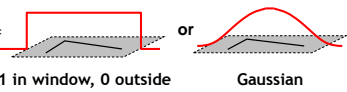

29

RWTH AACHEN UNIVERSITY

Harris Detector Formulation

- Change of intensity for the shift $[u,v]$:

$$E(u,v) = \sum_{x,y} w(x,y) [I(x+u, y+v) - I(x,y)]^2$$

Window function $w(x,y) =$ 

30

RWTH AACHEN UNIVERSITY

Harris Detector Formulation

- This measure of change can be approximated by:

$$E(u,v) \approx [u \ v] M \begin{bmatrix} u \\ v \end{bmatrix}$$

where M is a 2x2 matrix computed from image derivatives:

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

Sum over image region - the area we are checking for corner

$$M = \begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} = \sum \begin{bmatrix} I_x \\ I_y \end{bmatrix} \begin{bmatrix} I_x & I_y \end{bmatrix}$$

31

RWTH AACHEN UNIVERSITY

Harris Detector Formulation

where M is a 2x2 matrix computed from image derivatives:

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

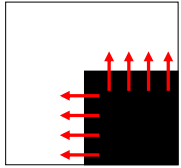

Sum over image region - the area we are checking for corner

$$M = \begin{bmatrix} \sum I_x I_x & \sum I_x I_y \\ \sum I_x I_y & \sum I_y I_y \end{bmatrix} = \sum \begin{bmatrix} I_x \\ I_y \end{bmatrix} \begin{bmatrix} I_x & I_y \end{bmatrix}$$

32

What Does This Matrix Reveal?

- First, let's consider an axis-aligned corner:

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

33

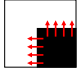

Slide credit: Kristen Grauman B. Leibe

What Does This Matrix Reveal?

- First, let's consider an axis-aligned corner:

$$M = \begin{bmatrix} \sum I_x^2 & \sum I_x I_y \\ \sum I_x I_y & \sum I_y^2 \end{bmatrix} = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$

- This means:
 - Dominant gradient directions align with x or y axis
 - If either λ is close to 0, then this is not a corner, so look for locations where both are large.
- What if we have a corner that is not aligned with the image axes?

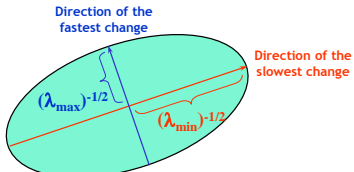

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

34

Slide credit: David Jacobs B. Leibe

General Case

- Since M is symmetric, we have $M = R^{-1} \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} R$
(Eigenvalue decomposition)
- We can visualize M as an ellipse with axis lengths determined by the eigenvalues and orientation determined by R

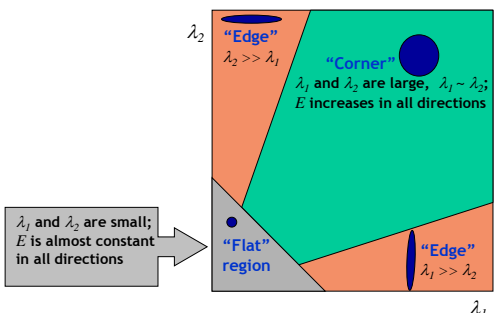

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

35

Slide credit: Kristen Grauman B. Leibe adapted from Darva Frolova, Denis Simakov

Interpreting the Eigenvalues

- Classification of image points using eigenvalues of M :

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

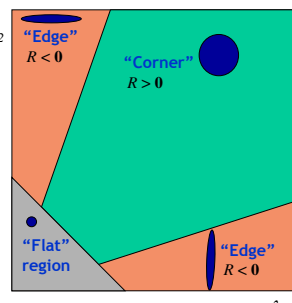

36

Slide credit: Kristen Grauman B. Leibe

Corner Response Function

$$R = \det(M) - \alpha \text{trace}(M)^2 = \lambda_1 \lambda_2 - \alpha (\lambda_1 + \lambda_2)^2$$

- Fast approximation
 - Avoid computing the eigenvalues
 - α : constant (0.04 to 0.06)

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

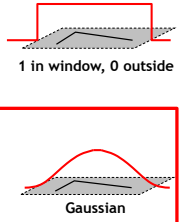

37

Slide credit: Kristen Grauman B. Leibe

Window Function $w(x,y)$

$$M = \sum_{x,y} w(x,y) \begin{bmatrix} I_x^2 & I_x I_y \\ I_x I_y & I_y^2 \end{bmatrix}$$

- Option 1: uniform window
 - Sum over square window
 - Problem: not rotation invariant
- Option 2: Smooth with Gaussian
 - Gaussian already performs weighted sum
 - Result is rotation invariant

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

38

Slide credit: Kristen Grauman B. Leibe

Computer Vision WS 15/16

RWTH AACHEN UNIVERSITY

Summary: Harris Detector [Harris88]

- Compute second moment matrix (autocorrelation matrix)

$$M(\sigma_x, \sigma_y) = g(\sigma) * \begin{bmatrix} I_x^2(\sigma_x) & I_x I_y(\sigma_x) \\ I_x I_y(\sigma_x) & I_y^2(\sigma_x) \end{bmatrix}$$

1. Image derivatives
2. Square of derivatives
3. Gaussian filter g(σ)

- 4. Cornerness function - two strong eigenvalues

$$R = \det[M(\sigma_x, \sigma_y)] - \alpha [\text{trace}(M(\sigma_x, \sigma_y))]^2$$

$$= g(I_x^2)g(I_y^2) - [g(I_x I_y)]^2 - \alpha [g(I_x^2) + g(I_y^2)]^2$$

- 5. Perform non-maximum suppression

RWTH AACHEN UNIVERSITY

From Points to Regions...

- The Harris and Hessian operators define interest points.
 - Precise localization
 - High repeatability

- In order to compare those points, we need to compute a descriptor over a region.
 - How can we define such a region in a scale invariant manner?
- *i.e. how can we detect scale invariant interest regions?*

54

B. Leibe

Computer Vision WS 15/16

Slide credit: Krystian Mikolajczyk B. Leibe 58

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

Naïve Approach: Exhaustive Search

- Comparing descriptors while varying the patch size
 - Computationally inefficient
 - Inefficient but possible for matching
 - Prohibitive for retrieval in large databases
 - Prohibitive for recognition

Slide credit: Krystian Mikolajczyk B. Leibe 59

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

Automatic Scale Selection

- Solution:
 - Design a function on the region, which is "scale invariant" (the same for corresponding regions, even if they are at different scales)

Example: average intensity. For corresponding regions (even of different sizes) it will be the same.

- For a point in one image, we can consider it as a function of region size (patch width)

Slide credit: Kristen Grauman B. Leibe 60

Computer Vision WS 15/16 RWTH AACHEN UNIVERSITY

Automatic Scale Selection

- Common approach:
 - Take a local maximum of this function.
 - Observation: region size for which the maximum is achieved should be *invariant* to image scale.

Important: this scale invariant region size is found in each image **independently!**

Slide credit: Kristen Grauman B. Leibe 61

Computer Vision WS 15/16

Technical Detail

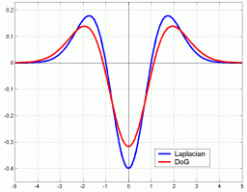

- We can efficiently approximate the Laplacian with a difference of Gaussians:

$$L = \sigma^2 (G_{xx}(x, y, \sigma) + G_{yy}(x, y, \sigma))$$

(Laplacian)

$$DoG = G(x, y, k\sigma) - G(x, y, \sigma)$$

(Difference of Gaussians)

Computer Vision WS 15/16

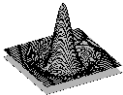

B. Leibe

78

Computer Vision WS 15/16

Difference-of-Gaussian (DoG)

- Difference of Gaussians as approximation of the LoG
 - This is used e.g. in Lowe's SIFT pipeline for feature detection.
- Advantages
 - No need to compute 2nd derivatives
 - Gaussians are computed anyway, e.g. in a Gaussian pyramid.

Slide credit: David Lowe

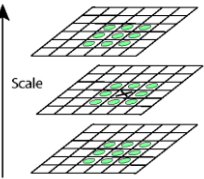

B. Leibe

79

Computer Vision WS 15/16

Key point localization with DoG

- Detect maxima of difference-of-Gaussian (DoG) in scale space
- Then reject points with low contrast (threshold)
- Eliminate edge responses

Candidate keypoints: list of (x, y, σ)

85

RWTH AACHEN UNIVERSITY

Summary: Scale Invariant Detection

- Given:** Two images of the same scene with a large *scale difference* between them.
- Goal:** Find *the same* interest points *independently* in each image.
- Solution:** Search for *maxima* of suitable functions in *scale* and in *space* (over the image).
- Two strategies**
 - Laplacian-of-Gaussian (LoG)
 - Difference-of-Gaussian (DoG) as a fast approximation
 - These can be used either on their own, or in combinations with single-scale keypoint detectors (Harris, Hessian).

Computer Vision WS 15/16

B. Leibe

86
